Executive Summary

Statistics Department conducted the lending survey for supervised deposit-taking financial institutions, for the quarter ended March 2018. The objectives of the survey were to: enhance BOU's understanding of the lending behavior and loan financing conditions among deposit-taking financial institutions; capture leading information on credit developments and bank lending on the Ugandan market during the quarter ended March 2018 and expectations for the quarter ending June 2018.

Credit Standards

In the third quarter of FY 2017/18, credit standards on loans to enterprises were eased at a higher pace than the previous quarter.

In terms of loan duration, banks eased credit standards at a higher pace for short terms loans and tightened at higher pace for long term loans in the quarter ended March 2018.

Across firm size, credit standards were eased at a higher pace compared to the previous quarter for SMEs and large enterprises in net terms.

In the quarter to June 2018, banks expect to further ease overall credit standards on a net basis. The net easing cuts across loans to SMEs and short term loans. On contrary banks expect to tighten the credit standards for large enterprises and long term loans. Reasons cited for easing include; reduction in the CBR and increased competition from other financial institutions.

Credit Standards by Economic Sector

In terms of credit standards to the different economic sectors; The Trade and Agriculture registered a net easing while the rest of the sectors registered a net tightening in the quarter ended March 2018.

Outlook on Demand for credit

In the quarter to June 2018, majority of banks anticipate an overall increase in demand for credit. The expected increase in demand cuts across all enterprises and loan durations.

The increase in demand is expected to be largely influenced by the Expected further decline in interest rates and continued marketing efforts as part of the bank's strategy to immensely grow SME credit.

Outlook on Terms & Conditions for credit

Price and non-price terms and conditions for consumer credit are expected to remain largely unchanged over the next three months to June 2018. On a net basis, banks indicated a net easing for average loans, prime borrowers, credit lines and maturity. On the other hand tightened for margin on riskier loans, collateral requirements and non-interest charges.

The major reasons cited for net easing include; BOU has continued to conduct a supportive monetary policy stance by gradually lowering the CBR from 15% to 9% which has led to reduction in pricing of loans.

Outlook on the default rate on loans

On a net basis, banks expect the default rate on loans to both enterprises and households to increase in the coming three months. The expected increase in default rate for enterprises and households is mainly attributed to the spill over effects of the prolonged droughts experienced at the beginning of the year and default on loans due to payment of school fees.

Interest Rate Expectations

The survey results indicate that the majority of banks expect their lending rates to decrease while on net basis to remain unchanged over the next quarter to June 2018.

Introduction

The lending survey conducted by Statistics Department captures past and prospective developments in the credit market. The survey is designed to complement existing quantitative data on credit and lending rates.

The main objectives of the survey are to:

- i) Enhance BOU's understanding of the lending behaviour and loan financing conditions among the deposit-taking institutions; and
- ii) Capture leading information on credit developments.

The survey covered the outturn for the quarter ended March 2018 and expectations for the quarter ending June 2018. Questionnaires were completed by all 24 commercial banks and 9 nonbank financial institutions in Uganda.

This report presents the findings from the analysis of the responses received from the commercial banks only. The methodology used in the analysis is detailed in Appendix 3. Detailed summary results of Non-bank financial institutions are presented in Appendix 2.

1. Survey Findings

1.1 Enterprises

1.1.1 Credit Standards to Enterprises

Credit standards consist of internal banking rules/criteria/guidelines which will determine (based on the classification by sector, area, size, duration, financial indicators, etc.) what types of loans (collateralised, non-collateralised, investment, overdraft etc.) and amount to be provided and to which clients. This survey measures changes in such standards including cases where a bank has introduced a new lending policy or amended existing one.

In the third quarter of FY 2017/18, credit standards on loans to enterprises were eased at a higher pace than the previous quarter.

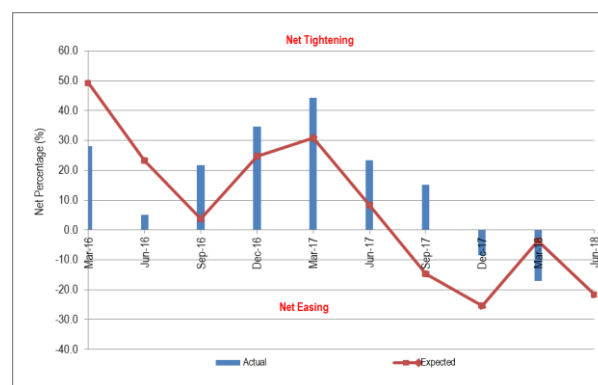

Banks reported eased credit standards on net basis at 17.2 percent in the quarter ended March 2018 compared to 8.5 percent recorded in December 2017. The overall net easing was much higher compared to the net easing of 3.7 percent that banks had anticipated in the previous survey (See *Tables 1 & 2 and Figure 1*).

Across firm size, credit standards were eased at a higher pace compared to the previous quarter for SMEs (from 10.6 percent to 35.5 percent) and tightened for large enterprises (from 2.9 percent net easing to 10.6 percent net tightening).

In terms of loan duration, banks eased credit standards at a higher pace for short terms loans and tightened at higher pace for long term loans in the quarter ended March 2018 (See *Table 1*).

Key reasons cited for the overall easing include: efforts by the banks to grow new lending across its SME segments to meet the set targets while maintaining the portfolio quality.

Figure 1: Overall Credit standards to enterprises

Source: Bank of Uganda

Notes:

(a) Net percentage balances are calculated by obtaining the difference between the percentage of lenders reporting that a factor has tightened/increased and those reporting that it has eased/decreased. A negative balance indicates that more credit is available.

(b) The bar graph shows the net percentage over the previous three months. The line graph shows the expectation over the next three months.

(c) Expectations have been moved forward one quarter so that they can be compared with the actual outturn in the following quarter.

Table 1: Credit Standards as applied to approval of loans to enterprises

Bank's action	Overall		Loans to SMEs		Large enterprises		Short-term Loans		Long-term Loans	
	Dec-17	Mar-18	Dec-17	Mar-18	Dec-17	Mar-18	Dec-17	Mar-18	Dec-17	Mar-18

Interpretation: Negative-net easing, positive-net tightening

Source: Bank of Uganda

In the quarter to June 2018, banks expect to further ease overall credit standards on a net basis. The net easing cuts across loans to SMEs and short term loans. On contrary, banks expect to tighten the credit standards for large enterprises and long term loans. (See Figure 1 and Table 2).

The main reasons cited by banks for the expected easing in credit standards, in the quarter to June

2018 include: reduction in the CBR and increased competition from other financial institutions.

On the other hand, banks that expect to tighten credit standards indicated that the tightening is meant to avert any increases in loan loss reserves within banks and banks implementation of the revisions in its credit underwriting process.

Table 2: Expectations for Credit Standards as applied to approval of loans to enterprises

Bank's expected action	Overall		Loans to SMEs		Large enterprises		Short-term Loans		Long-term Loans	
	Mar-18	Jun-18	Mar-18	Jun-18	Mar-18	Jun-18	Mar-18	Jun-18	Mar-18	Jun-18

Interpretation: Negative-net easing, positive-net tightening

Source: Bank of Uganda

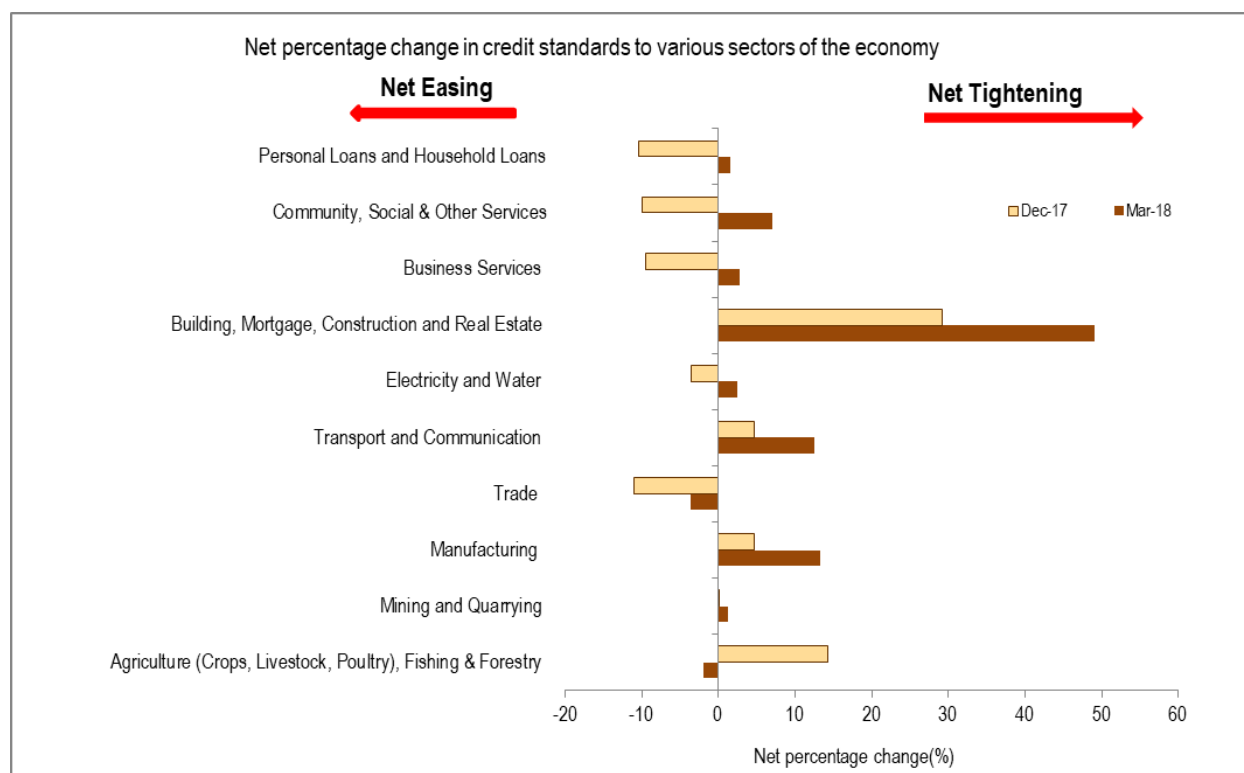

1.1.2 Credit Standards by Economic Sector

Banks were asked to indicate how their credit standards had changed for the different sectors of the economy. The Trade (3.7 percent) and Agriculture (2.0 percent) registered a net easing while the rest of the sectors registered net tightening in the quarter ended March 2018 (See Figure 2). Major reason given for net easing for trade sector was the increase in appetite for SME in this sector.

The building, mortgage, construction and real estate sector registered the highest net tightening

(49.0 percent) on account of the real estate market being slow and very transactions taking place. This sector was followed by Manufacturing (13.2 percent), Transport (12.5 percent) and Community, Social and Other Services (7.1 percent). The main reason cited for tightening in Manufacturing was the banks' cautious nature in dealing with large enterprises mainly due the high financial struggles experienced.

Figure 2: Changes in credit standards by economic sector

Source: Bank of Uganda

1.1.3 Expectations in the Terms and Conditions for Credit to Enterprises

Credit terms and conditions refer to the specific obligations agreed upon by the lender and the borrower. In the context of this survey, they comprise of:

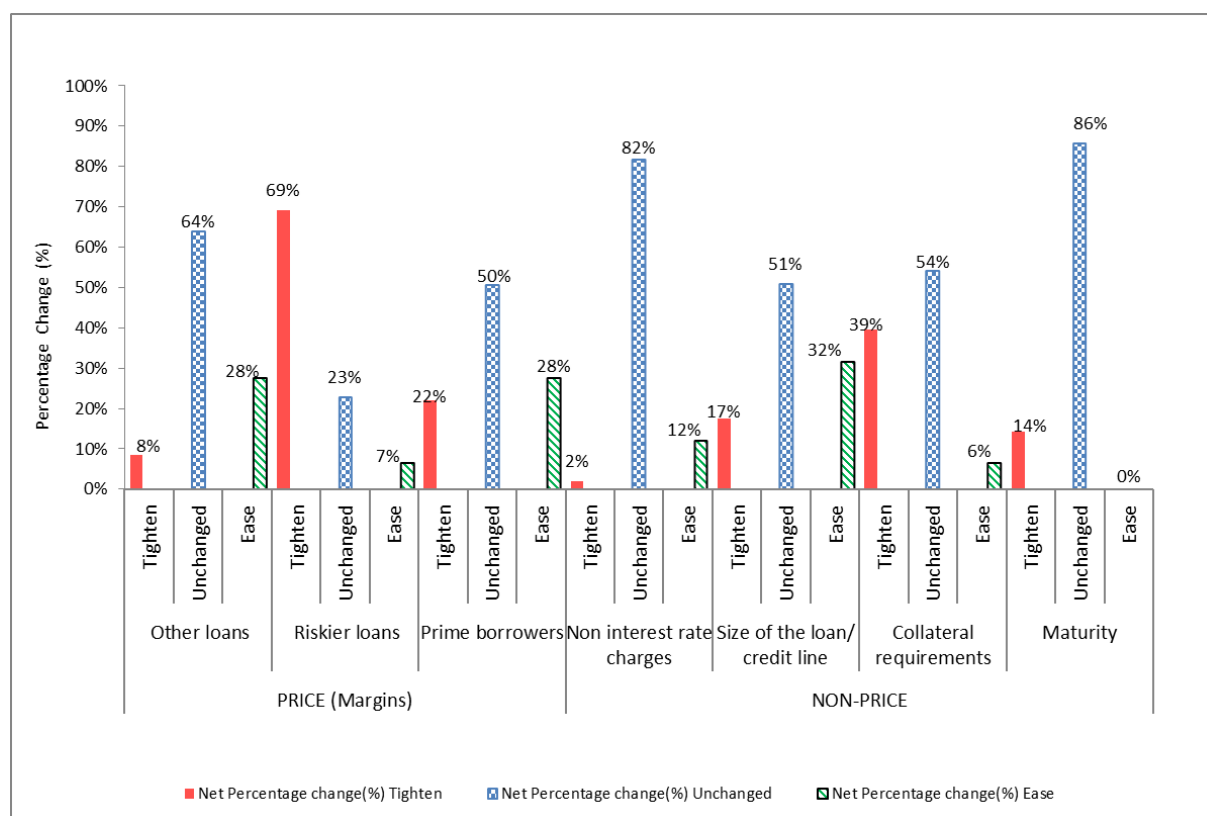

- a) Price-related terms and conditions that include the direct price or interest rate.
- b) Non-price related terms and conditions that include the maximum size of the loan, the access conditions as well as other terms and conditions in the form of: non-interest charges (e.g. fees); collateral requirements (including compensating balances); loan covenants and maturities (short-term versus long-term).

On a net basis, most banks expect price terms and conditions to ease in the quarter to June 2018, except for the margin on riskier loans which is expected to be tightened.

The easing of price terms and conditions is attributed to banks efforts aimed at maintaining the existing good clientele.

All non-price terms and conditions are expected to remain largely unchanged. However, collateral requirements and maturity of the loan are expected to be tightened on a net basis. (See Figure 3).

Figure 3: Expected changes in terms & conditions for approving loans to enterprises (April-June 2018)

Source: Bank of Uganda

1.1.4 Demand for Credit by Enterprises

In the quarter to June 2018, majority of banks (82.9 percent) anticipate an overall increase in demand for credit. The expected increase in demand cuts across all enterprises and loan durations. (See Table 3 below).

Some of the major reasons given for the overall expected increase in demand by enterprises above include:

- Expected further decline in interest rates and
- Continued marketing efforts as part of the banks' strategy to immensely grow SME credit.

Table 3: Demand expectations for the next three months (April –June 2018)

Bank's expected action	Overall		Loans to SMEs		Large enterprises		Short-term Loans		Long-term Loans	
	Mar-18	Jun-18	Mar-17	Jun-18	Mar-18	Jun-18	Mar-17	Jun-18	Mar-17	Jun-18
Increase(A)	72.8	82.9	74.1	85.8	67.6	76.8	75.4	83.5	69.9	75.1
Unchanged	25.1	17.1	21.3	10.0	32.4	20.8	24.6	16.5	30.1	24.9
Decrease(B)	0.0	0.0	0.1	0.0	0.1	2.4	0.0	0.0	0.0	0.0
Net %(A-B)	72.8	82.9	74.0	85.8	67.5	74.4	75.4	83.5	69.9	75.1

Interpretation: Negative-net decrease, positive-net increase

Source: Bank of Uganda

1.2 Households and Individuals

1.2.1 Credit standards to households

Banks eased credit standards to households and individuals on a net basis (11.1 percent) compared to the net easing of 24.0 percent observed in the previous period (See Appendix 1). The reduction in CBR was the main reason cited for easing of credit standards to households.

Similarly, in the quarter to June 2018, banks expect to ease credit standards to households, a net easing of 10.2 percent, attributed to banks' plans of increasing appetite aimed at growing the loan book and market share. (See Appendix 1).

1.2.2 Outlook on Terms and Conditions for Credit to Households

Price and non-price terms and conditions for consumer credit are expected to remain largely unchanged over the next three months to June 2018. On a net basis, banks indicated a net easing for average loans, prime borrowers and maturity. On the other hand tightened for margin on riskier loans, collateral requirements and non-interest charges. (See Appendix 1).

The major reasons cited for the net easing include; conducive monetary policy stance which has led to reduction in pricing of loans.

Major reasons that led to tightening include; tightened in order to maintain and improve the quality of the loan book and pricing is expected to be matched with the risk involved.

1.2.3 Demand for Credit by households

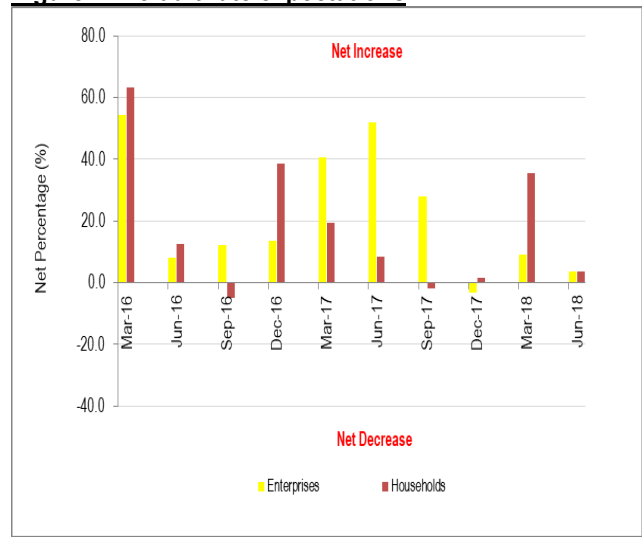

Credit demand by households is expected to increase in the three months to June 2018 with 79.4 percent of banks anticipating an increase, lower than the 89.2 percent that expected an increase in the previous survey. The anticipated increase in demand was attributed to; the expectation of a decrease in interest rates as a result of a fall in the CBR and the expenditure for Easter season.

1.3 Expected Default rate on loans to enterprises and households

Banks were asked to report their expectations on the change in default rates on loans to enterprises and households over the quarter to June 2018. On a net basis, 3.7 percent and 3.6 percent of the banks expect the default rate on loans to enterprises and households, respectively to increase in the coming three months to June 2018 (See Appendix 1).

The expected increase in default rate on loans to enterprises and household is mainly attributed to the spill over effects of the prolonged droughts experienced at the beginning of the year and default on loans due to payment of school fees.

Figure 4: Default rate expectations

Source: Bank of Uganda

1.4 Interest Rate Expectations for Q4 FY 2017/18

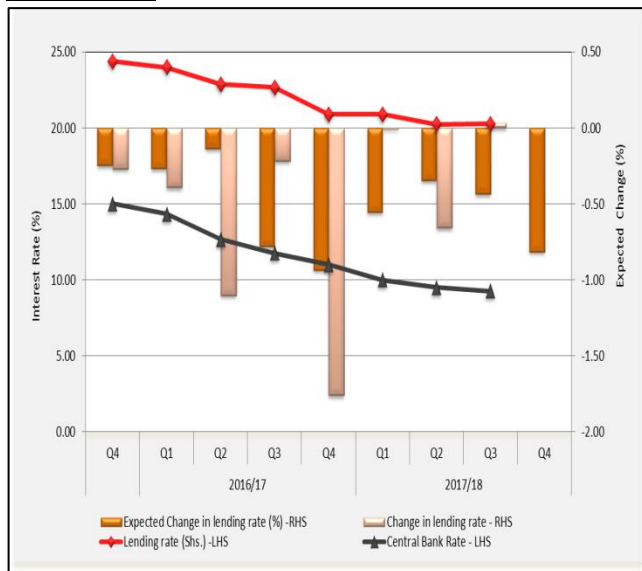

In an effort to understand the direction of interest rates from the lenders point of view, banks were asked to indicate the direction and magnitude of the change in their lending rate in the coming three months.

The survey results indicate that majority of the banks (68.3 percent) expect their lending rates to decrease, while 31.0 percent expect the rates to remain unchanged over the next quarter to June 2018.

The average percentage expected decrease in lending rates over the next quarter to June 2018 is estimated at 0.81 percentage points (See *Figure 5*).

The anticipated decline in lending rates was attributed to; improvement in the quality of loan portfolio and further reduction of CBR.

Figure 5: Changes in interest rates vis-à-vis Net Expectations

Source: Bank of Uganda

Notes: The line graphs show actual lending rate and CBR outturns over the quarter. The bar graphs show the average percentage, by which lending rates were expected to increase over the next quarter following the survey and the actual change in lending rates over the quarter. Expectations have been moved forward by one quarter so as to be comparable with the actual outturns.

1.5 Trend in Lending Rates

With regards to the observed decline in CBR, banks were further requested to provide their opinions on the slow decline in the lending rates on new loans to borrowers. The major reason provided by banks was the high cost of funding or borrowing that was acquired sometime back.

2. Conclusion

The bank lending survey results indicate that banks eased their credit standards to enterprises in Q3 FY 2017/2018.

Similarly the survey results indicate that banks eased their credit standards to households in the period under review.

The easing to enterprises was due to the expected improvement in macro-economic conditions and efforts by banks to grow the loan book.

The default rate on loans to both enterprises and households is anticipated to increase in the coming three months to June 2018 largely due to the spill over effects of the prolonged droughts experienced at the beginning of the year and default on loans due to payment of school fees.

The survey results indicate that majority of the banks expect their lending rates to decrease over the next quarter to June 2018. The banks that expect lending rates to decline cited the improvement in the quality of portfolio and further reduction in CBR as key factors.

APPENDICES

Appendix 1: Summary of Bank lending survey results																
<p>To calculate aggregate results, lenders who report that credit conditions have changed 'considerably' are summed together with those who report that conditions have changed 'somewhat'. These scores are then weighted by lenders' market shares. The weights used in the compilation were derived by taking an average of each institution's market share over the three month period, as represented by each bank's outstanding stock of loans to total outstanding loans of the commercial banking sector.</p> <p>The results are analysed by calculating 'net percentage balances' — the difference between the weighted balance of lenders reporting that, for example, demand was higher/lower or credit standards were tighter/looser. The net percentage balances are scaled to lie between ±100.</p> <p>This annex reports the net percentage balance of respondents for each question in the lending survey questionnaire.</p> <p>Positive balances indicate that lenders, on balance, reported/expected demand/default rate to be higher than over the previous/current three-month period, or that the credit standards/ terms and conditions on which credit was/ will be provided became tighter/ are expected to tighten.</p>

Net percentage balances are calculated by the difference between the weighted balance of lenders reporting that demand was higher/lower or credit standards were tighter/looser.</p> <p>Positive balances indicate that lenders, on balance, reported/expected demand/default rate to be higher than over the previous/current three-month period, or that the credit standards/ terms and conditions on which credit was/ will be provided became tighter/ are expected to tighten.</p>																

APPENDICES

Appendix 1: Summary of Bank Lending Survey results-Commercial Banks Appendix 2: Summary of Bank Lending Survey results-NBFIs

Appendix 2: Non bank Financial Institutions		Mar-17	Jun-17	Sep-17	Dec-17	Mar-18
<p>To calculate aggregate results, lenders who report that credit conditions have changed 'considerably' are summed together with those who report that conditions have changed 'somewhat'. These scores are then weighted by lenders' market shares. The weights used in the computation were derived by taking an average of each institution's market share over the three month period, as represented by each bank's outstanding stock of loans to total outstanding loans of the commercial banking sector. The results are analysed by calculating 'net percentage balances' — the difference between the weighted balance of lenders reporting that, for example, demand was higher/lower or credit standards were tighter/looser. The net percentage balances are scaled to lie between ±100. This annex reports the net percentage balance of respondents for each question in the lending survey questionnaire.</p> <p>Positive balances indicate that lenders, on balance, reported/expected demand/default rate to be higher than over the previous/current three-month period, or that the credit standards/terms and conditions on which credit was/will be provided became tighter/ are expected to tighten.</p>

Maturity	Next three months	-16.6	-21.9	0.0	0.0	-29.8
Default rate on loans to households						
	Next three months	4.1	11.5	21.4	-19.5	-11.3
<p>(a) Net percentage balances are calculated by the difference between the weighted balance of lenders reporting that, demand was higher/lower or credit standards were tighter/looser. Positive balances indicate that lenders, on balance, reported/expected demand/default rate to be higher than over the previous/current three-month period, or that the credit standards/terms and conditions on which credit was/will be provided became tighter/ are expected to tighten.</p> <p>(b) Small and Medium Enterprises (SMEs) was defined as an enterprise employing less than 100 employees where as large Enterprises are enterprises were defined as those enterprises employing more than 100 employees.</p> <p>(c) Expected change in lending rates (in percentage points) is calculated by summing up the weighted decreases/increases (or by multiplying the weights and expected change in lending rate) of the respective lenders.</p>						

APPENDIX 3: Methodology

Questions:

The questions in the lending survey questionnaire distinguish between two categories of loans namely: a) loans to enterprises and b) loans to households and individuals. For each category, questions were posed on credit standards for approving loans; credit terms and conditions; default rate; as well as credit demand and its determinants.

Weighting:

The results of the survey were weighted by the respective institutions' market share in the credit market. This approach takes into account the varying sizes and participation of the different respondent institutions in the formal credit market during the period under review. The weights used in the computation were derived by taking the sum of each institution's market share of credit over the three month period (December 2017 -February 2018), as represented by each bank's new gross extensions to total new gross extensions of the commercial banking sub sector for the same period.

Analysis of data:

For the analysis of aggregate results, lenders who report that credit conditions have changed 'considerably' are summed together with those who report that conditions have changed 'somewhat'. The results are summarized by calculating '*net percentage balance*' which is the difference between the weighted balances of lenders reporting that, say, demand had increased/ decreased or credit standards were tightened/ eased. The net percentage balances are scaled to a range between -100 and +100.

Positive net percentage balances indicate those lenders that reported/expected demand/default rate to be higher than the previous/current three-month period, or rather that the credit standards/ terms and conditions on which credit was/ will be provided became tighter/ are expected to tighten.(See *illustration below*)

On the other hand, interest rate expectations were derived by asking commercial banks whether they were likely to charge higher or lower lending rates in the next three months, compared to the previous quarter's levels and by how much.

Illustration:

'Eased somewhat' + 'Eased considerably' = Eased

'Tightened somewhat' + 'Tightened considerably' = Tightened

Response	Fraction of total giving response (%)
Eased / Decreased	X
Unchanged	Y
Tightened / Increased	Z
Net percentage change	Z- X

Interpretation of percentage change:
